

## SALMONELLOSIS

<b>ANIMAL GROUP AFFECTED</b>	<b>TRANSMISSION</b>	<b>CLINICAL SIGNS</b>	<b>FATAL DISEASE ?</b>	<b>TREATMENT</b>	<b>PREVENTION &amp; CONTROL</b>
Most commonly in Prosimiae, Old World monkeys and apes, less frequently in New World monkeys	Perorally	Diarrhoea with or without fever, asymptomatic carrier stages	Rarely	Revision of diet, supportive volumen and electrolyte substitution, eventually antibiotics after antibiogram	<i>In houses</i> Strict hygiene, food correction  <i>in zoos</i> strict hygiene, exclusion of raw chicken meat or eggs from the diet, no contact to infected animals, especially reptiles

<b>Fact sheet compiled by</b> Manfred Brack, formerly German Primate Center, Göttingen / Germany.	<b>Last update</b> November 2003
<b>Fact sheet reviewed by</b> W. Rietschel, Wilhelma Zoologischer-Botanischer Garten, Stuttgart, Germany C. Furley, Howletts Zoo, Bekesbourne, United Kingdom	
<b>Susceptible animal groups</b> All nonhuman primates, especially those of Old World origin.	
<b>Causative organism</b> <i>Salmonella</i> spp. (> 1800 <i>Salmonella</i> spp!).	
<b>Zoonotic potential</b> Yes.	
<b>Distribution</b> World-wide.	
<b>Transmission</b> Perorally.	
<b>Incubation period</b> 8 – 48 hs.	
<b>Clinical symptoms</b> Diarrhoea with or without fever, occasionally vomiting, abortion or osteomyelitis. Subsequently asymptomatic carrier stages may develop.	
<b>Post mortem findings</b> In clinical disease: Necrotizing ileocolitis with fulminant acute, diffuse inflammatory infiltration of the propria and submucosa, crypt abscesses, multifocal endocarditis, hepatitis, subcutaneous abscesses. In carrier stages no lesions.	
<b>Diagnosis</b> Cultivation: Enrichment media: tetrathionate medium, selenite F-broth etc., Plating media: MacConkey agar, S –S agar, Drigalski agar etc., Slide- or tube agglutination, Enzyme- immunoassays, Immunofluorescence.	
<b>Material required for laboratory analysis</b> Fresh faeces.

**Treatment**

Revision of the diet, elimination of accompanying parasites, supportive treatment (volumen- and electrolyte substitution). If necessary antibiotic treatment after preceding antibiograms. Antibiograms necessary because of increasing multiresistance of *Salmonella* spp.

**Prevention and control in zoos**

Rodent control, good hygienic practices, no feeding of raw chicken meat and eggs, separation of infected animals.

**Suggested disinfectant for housing facilities****Notification****Guarantees required under EU Legislation****Guarantees required by EAZA Zoos****Measures required under the Animal Disease Surveillance Plan****Measures required for introducing animals from non-approved sources**

**Measures to be taken in case of disease outbreak or positive laboratory findings****Conditions for restoring disease-free status after an outbreak****Experts who may be consulted**
